Comparison of various PEMF devices

Test device	Device name
Control	BEMER Classic
Test device 1	Magneter
Test device 2	Impulser
Test device 3	Terramagnon
Test device 4	SENTIPLUS
Test device 5	IMRS

Institute of Microcirculation – Berlin, Germany 20.2.2013

• Sample size n = 12

GP care with no pathology, exposure to moderate chronic stress and infection

• Physical data regarding the test subjects

Means and standard deviations

• Regarding use of the test appliances

ControlBEMER system 2 x daily 8 min spaced 2 h, mat, level 3Test appliances 1 - 5according to manufacturer specifications with comparable orsimilar application.

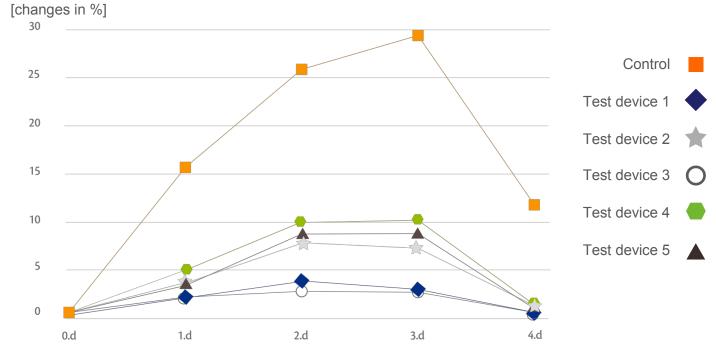

• Treatment interval day 1 to 3. Measurement interval 5 days.

> Day 0 – Determine the output values one day before the first treatment. Days 1, 2 & 3 – Collect measurement immediately after the second treatment on each treatment day.

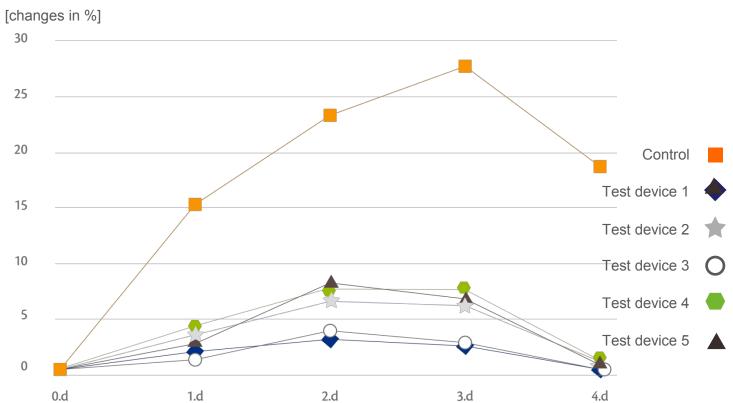

Day 4 – Residual effect.

Venular oxygen utilization

Target tissue :: intestines

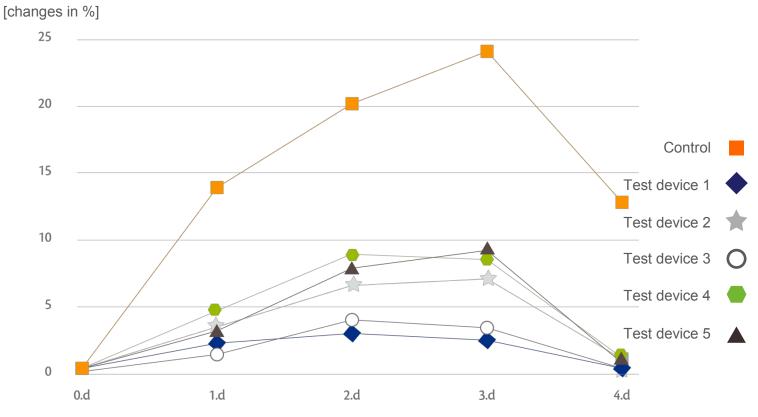

Number of blood cell-perfused nodal points Target tissue :: intestines

Venular flow

Target tissue :: intestines

Initial lymph flow Target tissue :: intestines [changes in %]
